# *Introduction*

DOC? CDOM?

# *Importance of DOM in the Carbon Cycle?*

- Dissolved Organic Matter (DOM) originates from terrestrial runoff, decaying marine organisms, and primary production.
- Decomposes by microbes, releasing carbon dioxide and nutrients for phytoplankton use.
- Tidal marshes and mangroves, contribute production and release of DOM

# *DOC*

- Sourced originates:
  - a. Decaying plants, animals, and other organic matter.
- Used to assess water quality and ecosystem health.

# *CDOM*

- Organic material in water that absorbs light
- Sources
  - a. decaying plants and other organic materials
- Influences water quality and light penetration in water

# *Goals of My Project*

- Collect and measure DOC and CDOM concentrations
- Analyze the differences in DOC and CDOM between tidal marshes and oyster aquaculture facilities

02

# *Methodology*

Methods on how we collect DOC & CDOM?

# *Sites and Maps*

## Sites

TM: Tidal Marsh

ES: Eastern Shore

JP: Jefferson Patterson

OA: Oyster Aquaculture

# *Isabela & Luisa*

- Teledyne ISCO autosampler
- Collects up to 12 mason jar-sized water samples.

# *How to prepare for CDOM?*

After the first filtration, then

- Filter through 0.2  $\mu\text{m}$  syringe filtered
- Analyze samples on Shimadzu UV-Vis 1900i

# Preparing DOC!

## Acidification

- 25  $\mu$ L 6 N HCL
- Samples ran through Shimadzu TOC-L analyzer.

## KHP Stock (Potassium Hydrogen Phthalate)

- KHP (potassium hydrogen phthalate) is used for the standard curve
- Used KHP stock to make working standards: 0.5, 1.0, 5.0, and 10.0 mg C/L

# *Prepping DOC Samples*

- Using a pipette add 8 mL of each sample in a test tube (1-10)
- Create a Blank
- Pick a random KHP Stock Standard

03

# *Results*

Compare & Contrast

# *Location x Site Averages DOC*

# *TM - Site Averages*

# *Location x Site Average CDOM*

p- value is  $p < 0.001$  for Location x Site.  
(Statistically Significant)

## OA - Site Averages

OA Averages - DOC

p-value = 0.0280894  
(Statistically significantly)

OA Averages - CDOM

p-value = 0.0005459  
(Statistically significant)

## *Location x Type CDOM*

p-value : 0.0005459  
(Statistically significant)

p-value: 0.0000145  
(Statistically Significant)

# Analysis

Goal: Analyze the differences in DOC and CDOM between tidal marshes and oyster aquaculture facilities

- Site Averages CDOM is lower for OA compared to TM
- Differences in DOC between the locations: The lowest average for CDOM was at OAJP
- CDOM was overall more variable between our locations and types of sites then DOC

# *Next Step*

- More measurements in different seasons and more locations
- Look more into the interactions between these variables and other variables such as POC, DOM, and more
